

JÜRI PETROTŠENKO

JUNIOR FULL-STACK ENGINEER

 [Portfolio](#)  [Harvar3105](#)  [jupetr](#)  jupetr3105@outlook.com Estonia, Tallinn

SUMMARY

Junior full-stack developer with a Bachelor's degree in IT Systems Development, backed by a development internship and independent full-stack projects covering microservice architecture, RESTful APIs, authentication, and containerized deployment.

WORK EXPERIENCE

AlphaCRC — Web Development Intern, Development Team

Jan 2025 – Jun 2025

- Independently redesigned a legacy visual behavior-configuration system within a company-wide internal dashboard platform used for task, pipeline, and project management.
- Migrated code generation and validation from server-side to client-side, reducing backend processing load.
- Rebuilt the block-based visual editor using scratch-blocks for improved usability, including custom blocks for chained behavior composition.
- Independently selected the technology stack and presented the solution to the development team, receiving positive feedback.
- Participated in code reviews and testing throughout the development lifecycle, working within an established professional software development workflow.

EDUCATION

Tallinn University of Technology

2022 – 2025

Bachelor's Degree — IT Systems Development

Broad full-stack-oriented curriculum covering programming fundamentals, algorithms and data structures, frontend/backend application architecture, operating systems, database systems, and cloud/web technologies.

TECHNICAL SKILLS

Languages	C#, TypeScript, JavaScript
Frontend	React, Next.js, Tailwind CSS
Backend	.NET, ASP.NET Core, EF Core, Node.js, RESTful APIs, JWT Authentication
Databases	MongoDB, Microsoft SQL Server, Redis
Tools/Infra	Docker, RabbitMQ, GitHub Actions, Microservice Architecture, WPF, WebView2

PROJECTS

GamesFinder

Github: [Frontend](#) | [Backend](#) | [Identity](#)

Independently designed and developed a microservice-based web application for aggregating game offers from multiple sources into a searchable, sortable interface.

- Architected a multi-service system (authentication server, backend orchestrator built in ASP.NET Core, independent data-collection workers, frontend) communicating through a message broker, with task coordination, result aggregation, and data persistence across MongoDB and Microsoft SQL Server.
- Self-taught and applied RabbitMQ for task distribution, Redis for intermediate result caching, and JWT-based authentication following security best practices.

MediaDownloader

[Github](#)

Independently designed and developed a portable Windows desktop application providing a graphical interface for yt-dlp — a WPF host embedding a WebView2-rendered React frontend, bridging UI interactions with a .NET backend that integrates yt-dlp for media extraction from user-provided URLs, with no external hosting dependency.
